TAC 1 Systems Buyers Guide

Parts & Accessories For

Harris P5300/5400/5500/7300 & XG15/25/75

NEW PRODUCT – Drop Damage Resistant Radio Cases

- Reduces maintainance & repair time/costs by protecting the radio from drop, impact, water & dust damage.
- Custom fit to Harris XG-25P & XG-75P radios with full or partial keypad.
- Constructed from durable ballistic nylon cordura.
- Features full top flap closure that helps prevent knob/control damage from drops as well as water and dust ingress.
- Available standard in **Low-Viz Black** or **Hi-Viz Orange W/Reflective**. *Other colors available by request.*
- High hang point raises center of gravity to reduce likelihood of drop.
- Carry attachments include belt loop, belt clip, swivel loop, and MOLLE.
- Includes top mounted D-Rings for attaching to shoulder straps or lanyards.
- Available accessories include: Paracord retention lanyard, shoulder strap & repl/xtra swivel loop.
- Made in the USofA!
- Lifetime workmanship warranty!

EXC902MD	902-960 MHz	Stubby – 3.75"	¼ Wave	\$18.50

Picking the correct antenna

WARNING: Using an antenna that is specified for the wrong frequency range or band can damage your radio.
If you are having trouble determining which antennas are appropriate and would like our help, please feel free to call us any time at 208-628-9112. We would be happy to help you.

The first thing you will need to determine is what frequency ranges (MHz) your radio is designed and programmed to operate at. If you work for a company or agency, try asking whoever is responsible for maintaining, issuing, programming or coordinating radios and/or frequencies at your work. Once you have determined what frequencies you use, match that up to the frequency range of the antennas available for your radio.

Example: If your frequencies are between 154.0000 - 158.0000, you should be looking at antennas rated for 150.0000 - 160.0000.

Once you have narrowed down your choices to a specific freq range, you will need to decide which length of antenna you want and is appropriate. In general, a longer antenna will perform better than a shorter one, but will be more cumbersome. If you are in an area that has good to excellent coverage, a stubby antenna may perform just fine and be more convenient and comfortable when worn than a long antenna. If you operate in an area that has poor, spotty or marginal coverage and/or you may need to transmit extended distances, you may want to put serious consideration into a long antenna. Standard antennas are intended to find a good balance between performance and size.
